PROJECT TOPIC

SmartPrep AI: Qualification-Based Company Hiring & Interview Portal

Abstract

Introduction: "SmartPrep AI" is an advanced web portal designed to streamline career placement preparation for students based strictly on their specific academic qualifications and skills, eliminating the confusion caused by generic job platforms.

Working Logic: After users submit their qualification and skill profile, the system's backend algorithm automatically filters and maps corporate hiring structures to display exact test patterns, while integrating the Gemini API to conduct dynamic, real-time mock interviews with immediate performance feedback.

Features & Problem Solving: The platform features a customized recruitment tracker, an AI interview simulator, and an automated job search engine. This successfully resolves the real-world challenge of cognitive fatigue by preventing fresh graduates from wasting time on irrelevant job openings.

Technology Used: The software is engineered using a robust tech stack, leveraging React.js, HTML, and CSS for the frontend, Python (Django/Flask) for core backend logic, a MySQL database, and the Gemini API for intelligence.
